

Adult Immunizations

Some adults incorrectly assume that the vaccines they received as children will protect them for the rest of their lives. Generally this is true, except:

- Some adults were never vaccinated as children
- Newer vaccines were not available when some adults were children
- Immunity can begin to fade over time
- As we age, we become more susceptible to serious diseases caused by common infections (e.g. flu, pneumococcus)

The PAIC has produced a unique video featuring a 2 minute and 17 minute PSA informing adults of the importance of immunization for themselves, thier spoused and their parents. The story line of the PSA features four different senarios: a couple involved in an international adoption, a high school graduate about to go to college, an adult who becomes the caretaker for an elderly relative and a man who has cancer and must rely on the community to be immunized to protect his health.
